Accessibility remediation and build partner for audit firms

You find the issues. We help your clients fix them. Rosemark Co is a small Melbourne accessibility remediation and web build partner that can take on the remediation and build work that follows a WCAG 2.2 AA audit, under your brand or ours, so your team can stay focused on auditing.

> **What you gain:** extra hands for fixes and accessible page builds when your clients ask "who can do this for us?" · turnaround agreed in writing per job · a white-label option · plain-English fix notes your clients' teams can act on · a short, evidenced hand-back so your auditors can retest quickly.

Who we are

Rosemark Co is a small studio based in Melbourne, Victoria (Tugba Korkmaz, sole trader, ABN 35 885 771 401, trading as Rosemark Co). We fix and build accessible web pages for councils, government suppliers, aged care providers and accessibility consultancies. We are **not** an accredited audit firm and do not issue formal WCAG audits or conformance certificates. That work stays with you. We hold no accessibility certifications (such as IAAP CPACC or WAS) today.

Services

Service	What it covers
Remediation from your audit findings	Fixing HTML, CSS and ARIA issues your audit identifies (for example contrast, headings, landmarks, link text, focus styles, reflow, form labels), batched by priority, with a fix log matched to your finding IDs.
Accessible builds for new pages	Designing and building new pages, templates or components to WCAG 2.2 AA from the start, ready for your audit.
Pre-hand-back self-check	Before we hand back, we run automated checks, code-level review, keyboard-only navigation, and 320px reflow and text-spacing checks, then note what was checked and how.
Plain-English fix notes	Short "what changed and why" notes your client's team can follow and maintain.
Conformance summary support	We can help draft a VPAT-style table of what was fixed, for your auditors to verify. The conformance judgement stays with you.

How we work

- **Standard:** WCAG 2.2 Level AA success criteria. WCAG is the basis of AS EN 301 549 (Australia's ICT accessibility procurement standard) and is widely used as the benchmark for web accessibility under the *Disability Discrimination Act 1992* (Cth).
- **Checks we can do today:** automated scans (for example axe-core), code-level review of markup, CSS and ARIA, colour contrast calculated from the real colour values, keyboard-only navigation, 320px reflow (the test that stands in for 400% zoom) and text-spacing checks.
- **What we do not offer today:** screen-reader testing with NVDA, JAWS, VoiceOver or TalkBack, testing with people with disability, or formal audits. If you need these on a job, your testers or a verified tester you approve can cover them, and we fix what they find.
- **Evidence:** every fix links back to the finding, the change made, and how we checked it.

Working with primes

White-label	Yes. We can work under your brand with no direct client contact unless you want it.
Terms	Happy to work under your subcontract terms and sign your NDA before seeing any client material.
Turnaround	Scope, timing and price agreed in writing before work starts. Small studio; timing confirmed in writing for each job.
Rates	On request: fixed price per batch of fixes or per page built, agreed per engagement.
Insurance	Professional indemnity and public liability cover: **to be confirmed before engagement.**

How we use AI

Our work is **AI-assisted with human review**. We use AI tools to help review markup, suggest code fixes and draft fix notes. A person reviews every change and every note before anything is handed back, and nothing goes out on AI output alone.

- We do not put client data or non-public client material into public AI tools without your written consent.
- We can agree data location and handling rules with you before any client material is shared.
- Happy to follow your own AI and data-handling rules on any job.
